

Filters & Outlier Elimination

Filtering

- Why?
 - When we scan we are picking up everything about a surface
 - Filtering separates the different types of errors
 - Form (Low Frequency)
 - Waviness (Mid Frequency)
 - Surface Finish (High Frequency)
- A CMM can't check surface finish
 - Including surface finish will falsify the form measurements

Filter Types

- Mechanical - Size of Stylus (*pg 54*)
- Morphological – Digital (*pg 55*)
 - Low Pass
 - Keeps low frequency (Sub-woofer)
 - Used on CMMs (size, form, & location)
 - High Pass
 - Keeps high frequency (Tweeter)
 - Used for Surface Finish
 - Band Pass
 - Removes very low & very high (mid range)
 - Used for Waviness

Filter Types

Low pass

Band pass

High pass

Filter Basics

- The main setting for a filter is the length of the filter wave or the number of waves
 - Wavelength for linear features (λ_c)
 - Undulations for round features (UPR)
- Length determines amount of filtering
 - Linear: Shorter wavelength is less filtering
 - Round: More undulations is less filtering

Filter Basics

- Using a weighting function at each point, a new point is calculated using this point and surrounding points within the length of the weighting function.

Gaussian Filter

Filter Methods

- 2RC (ISO 4291)
 - Mathematical representation of electrical circuit (R=Resistor, C=Capacitor)
 - 75% of values are accepted (damped by $\frac{1}{4}$)
 - Not commonly used

Filter Methods

- Gauss (ISO 16610-21/28)
 - Uses a bell curve to weight & recalculate points
 - 50% of values are accepted
 - Most Industry Accepted
 - Doesn't do well with outliers or open contours

Filter Methods

- Spline (ISO 16610-22)
 - Uses a cubic spline function (3rd order polynomial)
 - Faster calculation than Gauss (no weighting)
 - Better functionality with outliers & open contours
 - Newer & not as widely accepted as Gauss

Robust Spline

Number of Points

- A filter needs at least 7 points per wave
- Linear Features (step width)

$0.8 \lambda_c$	$2.5 \lambda_c$	$8.0 \lambda_c$
0.11mm	0.35mm	1.14mm

- Round Features (number)

15 UPR	50 UPR	150 UPR
105pts	350pts	1050pts

- Filtering occurs AFTER outlier elimination
 - Minimums are not enough
 - Use recommended settings from cookbook

Recommended Settings

Round Features

Borehole/shaft diameter	Cutoff wavelength	Probing points per circle, angle range	Contact sensor Stylus tip diameter
<8 mm	15 UPR Gaussian filter	min. 145 for 400°	max. 3 mm
8 to 25 mm	50 UPR Gaussian filter	min. 425 for 380°	max. 3 mm
26 to 80 mm	150 UPR Gaussian filter	min. 1270 for 380°	max. 3 mm
81 to 250 mm	500 UPR Gaussian filter	min. 4250 for 380°	5 mm
>250 mm	1500 UPR Gaussian filter	min. 12700 for 380°	>5 mm

- Cookbook recipe Z100

Recommended Settings

Linear Features Location

Surface size (length)		
<25 mm	$\lambda_c = 0.8$ mm Gaussian filter	Stylus tip diameter: 3 mm Max. scanning speed: 3 mm/s Step width: 0.1 mm
>25 to 80 mm	$\lambda_c = 0.8$ mm Gaussian filter	Stylus tip diameter: 3 mm Max. scanning speed: 5 mm/s Step width: 0.1 mm
>80 to 250 mm	$\lambda_c = 2.5$ mm Gaussian filter	Stylus tip diameter: 3 mm Max. scanning speed: 10 mm/s Step width: 0.31 mm
>250 mm	$\lambda_c = 8.0$ mm Gaussian filter	Stylus tip diameter: 5 mm or more Max. scanning speed: 20 mm/s Step width: 1 mm

Calypso Settings

Calypso Settings

- Feature Settings transfer to characteristics & alignments
- Resources > Save/Load Defaults
 - Applies to Characteristics only

Outlier Elimination

- Used to remove points that we didn't intend to measure (chips, nicks, fuzz, burrs, pores, boogers...)
- Based on the standard deviation (σ or sigma) of the calculated feature
 - Sigma is multiplied by a factor (usually ± 3) to determine acceptable limits from feature
 - Any point outside limits is removed
- Example:
 - A feature has a $10\mu\text{m}$ σ with a factor of ± 3
 - Any point $> 30\mu\text{m}$ from the actual feature is removed

Outlier Example

- Standard Deviation is a predictor
 - If the data points follow a normal distribution (bell curve), a certain percentage of data will exist in each range
 - Most things don't follow a perfect bell curve so there may not be anything at the extremes or there could be lots.
 - As a general rule, don't eliminate more than 5% of points

Outlier Settings

The screenshot shows a software dialog box titled "Outlier Mode" with a close button (X) in the top right corner. The dialog is organized into four main sections, each with a bracket on the right side pointing to an explanatory text label. The first section, "Factor For Outlier", contains two input fields: "Inside Workpiece" and "Outside Part", both set to "3.00". The second section, "Range Of Data Reduction", has three radio button options: "Only Outlier", "Include Adjacent Points" (which is selected), and "To Computed Feature". Under "Include Adjacent Points", there is a "Number" input field set to "5". The third section, "Repeated Outlier Recognition", contains a "No. of iterations:" input field set to "1". The fourth section, "Prefilter for outlier recognition", has two radio button options: "Undulations Per Revolution" and "Wavelength Lc" (which is selected). Under "Wavelength Lc", there are two input fields: "From:" set to "0.0000" and "to:" set to "10.0000", followed by the unit "mm". At the bottom of the dialog are "OK" and "Cancel" buttons.

Section	Setting
Factor For Outlier	Inside Workpiece: 3.00
	Outside Part: 3.00
Range Of Data Reduction	Include Adjacent Points (selected)
	Number: 5
Repeated Outlier Recognition	No. of iterations: 1
Prefilter for outlier recognition	Wavelength Lc (selected)
	From: 0.0000 to: 10.0000 mm

Standard Deviation Factor

Number of point to eliminate

Number of times to find outliers

Prefilter for mean feature

Standard Deviation Factor

- Defines the limits for identifying an outlier
 - Inside Workpiece = Into Material
 - Outside Part = Out of the Material
- The factor is the number of standard deviations
 - A smaller number is more aggressive

Factor For Outlier	
Inside Workpiece	<input type="text" value="3.00"/>
Outside Part	<input type="text" value="3.00"/>

Number of Points

- When an outlier is found, how many points are removed
- Calypso defaults to Only Outlier
- Cookbook recommends 5 adjacent points
 - For each outlier found, the outlier + 5 points on each side is removed (11 total points)
 - Typically there are points leading to and from the outlier that should not be there...chip or burr
- To computed feature gets rid of all points near the outlier that are on the same side of the calculated feature. Use with extreme caution!

Range Of Data Reduction

☐ Only Outlier

☒ Include Adjacent Points

☒ Number

☐ To Computed Feature

Iterations

Repeated Outlier Recognition

No. of iterations:

1

- When the first calculation of the standard deviation occurred, the outliers contributed to the size of the standard deviation
- By removing the outliers the new standard deviation will be smaller & there may be points outside the limit using the new value
- Removing adjacent points makes iterating more than once unnecessary
 - Typically only used if removing only outlier
 - Iterating more than once starts to move into the arena of removing valid data

Prefilter

- Prefilter is used to calculate a computed feature that considers the form of the actual feature
- A Band Pass filter is applied such that the extremely low and high wavelengths are ignored when computing the feature
- Without the prefilter, features with high form deviation may not recognize outliers due to the high standard deviation
 - Oval or lobed circles
 - Concave/Convex planes

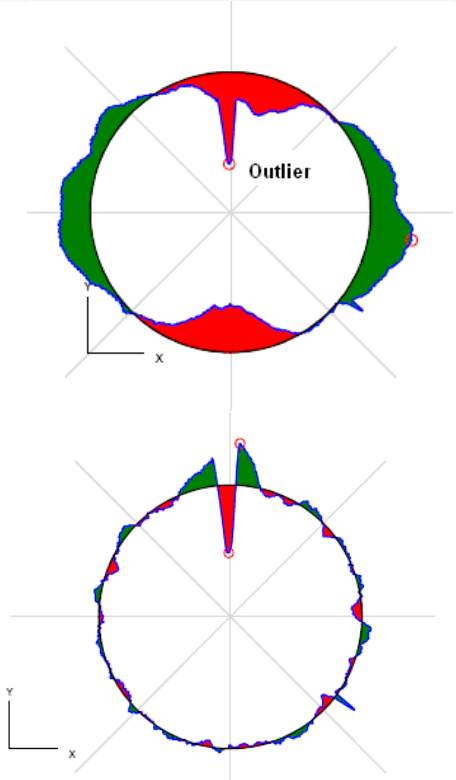

Prefilter for outlier recognition

☐ Undulations Per Revolution

From: 0 to 5000 upr

☒ Wavelength Lc

From: 0.0000 to 10.0000 mm

Extreme Low Frequency Removed

Summary

- Filtering
 - Used to separate different errors that exist on parts
 - On a CMM we remove High Frequency error (surface finish) so the Low Frequency error (form) can be inspected without extra influence
 - Filtering is done in accordance with accepted ISO standards
- Outlier Elimination
 - Looks for and removes points that should not have been measured
 - Based on standard statistical methods (standard deviation)
- Both require high data density to work properly
